

WHATSAPP-POWERED INTELLIGENT PATIENT ENGAGEMENT FOR FERTILITY CARE

PROBLEM STATEMENT

Fertility treatment involves multiple consultations, appointments, scans, laboratory investigations, medications, procedures, payments, and follow-up activities. Patients require timely and accurate communication throughout their treatment journey.

In many fertility clinics, these communications are still handled manually through phone calls and WhatsApp messages. This increases administrative workload and can result in missed reminders, delayed communication, and inconsistent patient follow-up.

The challenge is to develop an intelligent WhatsApp-based patient engagement platform that can connect with a fertility clinic's management system or EMR and automate relevant patient communications based on appointments, treatment milestones, investigations, procedures, payments, and follow-up requirements.

CORE REQUIREMENTS

- Automate appointment communication: confirmation, reminders, rescheduling/cancellation, and missed appointment follow-up.
- Support fertility treatment workflows: OI, IUI, IVF, and pregnancy follow-up.
- Automate investigation/report communication: report availability notification and secure report access.
- Automate billing communication: invoice, payment confirmation, receipt, and pending payment reminder.
- Provide an interactive WhatsApp assistant: book appointment, view appointment, treatment status, reports, billing, and contact clinic.
- Provide a clinic-side dashboard: communication status, patient responses, pending actions, failed messages, and workflow monitoring.

BONUS FEATURES

- AI-powered FAQ assistant
- Tamil/English multilingual support
- Intelligent reminder scheduling
- Automated escalation to staff
- Patient re-engagement
- Conversation analytics
- Consent and communication preferences
- Role-based access
- Audit trail
- AI-based query classification
