

CANDIDATE TRUST & FRAUD INTELLIGENCE PLATFORM

PROBLEM STATEMENT

Modern hiring increasingly relies on digital applications, remote assessments and virtual interviews. At the same time, AI can generate polished resumes, cover letters and interview responses at scale, making it harder for employers to distinguish authentic candidate capability from inaccurate, duplicated or fraudulent representation.

Develop a Candidate Trust & Fraud Intelligence Platform that acts as a trust layer across the complete hiring journey. The system should continuously verify whether the same real person, with the claimed identity, experience and demonstrated skills, is progressing through each stage from application to onboarding.

CORE REQUIREMENTS

- Identity verification and continuity across application, assessment, interview, offer and onboarding.
- Employment, education and reference verification with clear verification status and evidence.
- Duplicate-profile and recurring-identity detection across candidate records.
- Resume inconsistency detection for conflicting dates, roles, skills, projects or credentials.
- Suspicious application-pattern detection using session, device and behavioral risk signals.
- Interview identity-continuity checks using appropriate voice/video anomaly signals.
- Assessment-integrity monitoring to identify impersonation or unusual completion patterns.
- An explainable Candidate Trust Score that shows the signals contributing to the result.

EXPECTED WORKFLOW

The prototype should demonstrate a continuous flow such as: Apply → Identity → Resume → Assessment → Interview → Offer → Onboarding. Trust signals should be updated throughout the process rather than treated as a one-time background check.

PRIVACY & ENTERPRISE READINESS

The solution should support consent, privacy, secure handling of verification data, configurable retention and human review. It should be suitable for enterprise recruiting, staffing, contractor hiring, remote hiring and high-volume professional recruitment without automatically rejecting candidates solely for legitimate AI-assisted job-search activity.
