

AI APPLICATION FIREWALL

PROBLEM STATEMENT

AI-enabled job-search tools can discover openings, tailor resumes, generate screening answers and submit applications rapidly. Recruiters may therefore receive far more applications than traditional applicant tracking systems were designed to evaluate, increasing duplicate submissions, low-intent applications and fraudulent or misleading profiles.

Develop an AI Application Firewall that sits in front of an ATS and analyzes every incoming application before it enters the recruiter workflow. The system should separate authentic, qualified candidates who may legitimately use AI assistance from automated application noise or fraudulent representation.

CORE REQUIREMENTS

- Integrate as a pre-ATS verification layer through APIs, webhooks or configurable connectors.
- Detect duplicate applications, duplicate profiles and repeated identity patterns.
- Identify highly automated or suspicious submission behavior without treating normal AI usage as fraud.
- Check basic qualification alignment between the job requirements and the candidate profile.
- Detect resume inconsistencies, copied or synthetic-looking project claims and conflicting profile information.
- Use identity, device, session and behavioral signals to estimate application risk.
- Produce an explainable trust/risk result and reason codes for recruiter review.
- Route applications into configurable paths such as Pass to ATS, Additional Verification or Manual Review.

EXPECTED WORKFLOW

A suggested flow is: Job Application → Application Firewall → Identity/Profile Checks → Automation & Consistency Analysis → Qualification Check → Trust/Risk Decision → ATS / Verification Queue / Human Review.

INTEGRATION GOAL

The solution should complement rather than replace existing recruiting systems. The prototype should demonstrate how the firewall can work ahead of platforms such as Workday, SuccessFactors, Greenhouse, iCIMS or Oracle while providing recruiters with a concise dashboard of filtered volume, flagged reasons and verification status.
