

AI HIRING GOVERNANCE & COMPLIANCE OS

PROBLEM STATEMENT

Enterprises may use different AI systems for resume screening, candidate ranking, assessments, interviews, sourcing and candidate communications. When a hiring decision is questioned, Talent Acquisition, Legal, Compliance or Internal Audit may need to know which system was used, what information it considered, what it recommended and whether a human reviewed the result.

Develop an AI Hiring Governance & Compliance OS that inventories AI used across the hiring lifecycle and produces a traceable, reviewable audit record for automated or AI-assisted employment decisions.

CORE REQUIREMENTS

- Maintain an inventory of AI models, vendors and tools used at each stage of the hiring process.
- Record the candidate evaluated, model/tool used, version, timestamp and workflow stage.
- Capture what information was considered and what recommendation, score or classification was produced.
- Record whether a human reviewed, accepted, changed or overrode the AI recommendation.
- Track required notices, consent or communication preferences as configurable governance controls.
- Monitor changes in selection outcomes, adverse-impact indicators and model behavior over time.
- Detect missing documentation, unapproved tools, policy violations or unexplained workflow changes.
- Generate a searchable AI Hiring Audit Trail for HR, Legal, Compliance, Procurement and Internal Audit.

EXPECTED WORKFLOW

A suggested flow is: AI Tool Registration → Policy Mapping → Candidate Evaluation Event → Human Review → Decision Record → Monitoring → Audit Report. Users should be able to trace an individual hiring event as well as review organization-wide trends.

EXPECTED OUTCOME

The prototype should provide a governance dashboard showing active AI tools, approval status, logged hiring events, missing controls, review history, model or outcome changes and exportable audit evidence. The design should be extensible to other workforce decisions such as promotion, workforce planning or performance-management AI.
